

GÜHRING

Ratio®

Roughing end mills The complete programme

GÜHRING – YOUR WORLDWIDE PARTNER

NEW **RATIO®**-HIGH-PERFORMANCE ROUGHING END MILLS with optimised geometries

the innovative round knuckle HRf geometry ensures particularly small chips

with neck clearance and 2 length options

high cutting efficiency, round knuckle HRf geometry for minimum power consumption and lower cutting force

larger flutes guarantee an optimal chip evacuation with increased feeds

large face chip chambers and double protected cutting edge corners for minimum vibration plunging, ramping and orbital milling

new roughing end mill with **ROUND KNUCKLE-TYPE GEOMETRY**

- // perfect stability thanks to extra-flat round knuckle-type HRf roughing geometry
- // lower cutting forces ideal for less powerful machines & clamping conditions
- // stable machining conditions allow high metal removal rates with cutting depths up to 2xD

You can find the new roughing end mills with round knuckle-type geometry on page 10 and 11.

short chips thanks
to innovative
roughing geometry

more stable asymmetrical
knuckles produce smooth
rough-finish surfaces

larger flutes for
optimal chip evacuation

roughing geometry reduces the
cutting pressure in comparison
to smooth cutting milling cutters

HPC

new roughing end mill with FLAT KNUCKLE-TYPE TEETH

- // increased metal removal rate by utilising the entire cutting edge length
- // up to 60% longer tool life with high process reliability
- // ideal for less powerful machines and unstable clamping

You can find the new roughing end mills with flat knuckle-type teeth from page 12.

For high-performance roughing of aluminium with Carbo-coating

RF 100 A WF | page 23-26

For machining of steel, high tensile and cast iron materials

RF 100 U HF | page 12-14

Universal application for soft tough steels, stainless, low-alloyed cast iron and non-ferrous materials

RF 100 VA NF | page 16-17

RATIO

RATIO END MILLS

- // extremely smooth operation and max. metal removal rates thanks to unequal helix angles and unequal cutting edge
- // long tool life and process reliable machining thanks to tough carbide substrates and wear-resistant coatings
- // material-specific flute profiles and face cutting for optimal smooth running and perfect chip evacuation

For universal roughing operations

GS 100 U | page 19-20

For high-performance roughing of
aluminium and non-ferrous metals

GS 100 A | page 27

For all tough materials

RS 100 U | page 18

Machining of high tensile materials

RS 100 F | page 15

UNIVERSAL

ISO code

P	Steel, high-alloyed steel
M	Stainless steel
K	Grey cast iron, spheroidal graphite iron and malleable cast iron
N	Aluminium and other non-ferrous metals
S	Special, super and titanium-alloys
H	Hardened steel and chilled cast iron

On the product pages you will find recommendations on the suitability for the application groups and information on the max. tensile strength and hardness for every tool:

- optimal suitability
- limited suitability

Coatings

- bright

- ⊙ FIRE/nano FIRE
- ⊙ TiAlN nanoA
- ⊙ Signum

Pictograms

Tool material	VHM Solid carbide finest grain (carbide-UF)	HSS-E-PM High speed steel
Shank form	 to DIN 6535	
Standard	 to DIN	
	 to Gühring standard	
Type	 Application area similar to DIN 1836	
Applications	 Slotting Roughing Ramping Helix Drilling	
Length	 short (DIN) medium length extra length 3xD	
Number of cutting edges	 Number of major cutting edges	
Helix angle	 Size of helix angle/number of different helix angles	
Rake angle	 Rake angle of circumference cutting edges	
Cutting edge form	 Corner chamfer	
Feed	 for lateral feed and oblique plunging for lateral feed, oblique plunging and drilling	

RF 100 HRf

GS 80 – High-performance PM roughing end mills for difficult applications in steel and high strength steels

Optimal chip evacuation
thanks to curved, deep flute geometry

Minimum cutting pressure and power consumption
thanks to 45° helix angle and fine NRf roughing geometry.
Application also on less rigid machines and with unstable clamping.

High heat resistance and toughness
thanks to HSS-E-PM tool material with FIRE-coating.
Especially for tough and difficult-to-machine materials.

Innovative roughing geometry
ensures small chips

Roughing end mills GS 80 (fine teeth)

Foundations for economically efficient milling

Peripheral requirements

Applicable in every material group

- easy to machine materials = increase in productivity
- difficult to machine materials = increase in process reliability

High-dynamic machining centres

- short acceleration distances
- higher speed range
- small to medium tool diameters

Heavy machines

- stable feed axes
- high spindle torque
- medium to large tool diameters

Unstable to stable workpiece clamping

- stable = vibration-free machining = maximum metal removal rate
- unstable = reduction of radial forces = increased process reliability

Application parameters

Low cutting width a_e to $0.33 \times D$

- low angle of engagement $< 70^\circ$
- short t. of contact between cutting edge and component

Very high tooth feed f_z

- reduced chip thickness allows considerably higher f_z

Very high cutting speed v_c

- reduced heating up and prolonged cooling down allow very high v_c values

High cutting depth a_p

- improved leverage effect
- high metal removal rate
- increase in contact points between tool and component

Tool angle of engagement & tool contact time

Metal removal rate

The metal removal rate specifies how high the actual chip removal is per minute. It is especially suitable for comparing different machining strategies.

$$a_p \text{ (mm)} \times a_e \text{ (mm)} \times v_f \text{ (m/min)} = Q \text{ (cm}^3\text{/min)}$$

General recommendation for tool cooling

Steel			<ul style="list-style-type: none"> • Avoid thermal shock
Cast iron		Dry machining, compressed air, MQL:	<ul style="list-style-type: none"> • Dissipate machining temperature via chip • Supporting chip evacuation
Hardened			
Stainless		Soluble oil, neat oil:	<ul style="list-style-type: none"> • Cooling of tool cutting edge • Preventing built-up edge
Special alloy			<ul style="list-style-type: none"> • Supporting chip evacuation
Non-ferrous metals		Soluble oil, neat oil:	<ul style="list-style-type: none"> • Preventing built-up edge • Supporting chip evacuation

Exceptions for material ranges

When **coolant** is not available the cutting speed (v_c) and/or the radial feed (a_e) should be reduced. The resulting reduced temperature reduces the risk of thermal shock.

If there are **chip evacuation problems** the application of coolant should be taken into consideration, poor evacuation of chips can lead to massive tool wear and even tool breakage.

When **heat is being generated due to poor chip evacuation**, it should be checked if through coolant is available. By using a specifically directed “coolant jet”, coolant can be supplied where congested without hitting the cutting area. Alternatively, the application of coolant for the entire machining operation is recommended.

Other notes

Finishing

The application of coolant is principally an advantage as a better surface finish can be achieved.

Very long tools

Coolant can result in a smoother process, as the lubricant has a vibration-reducing effect.

Alignment of coolant

- as accurate as possible in the cutting area from at least three directions
- no flushing back of small chips to the cutting area

Solid carbide milling cutters with internal cooling

- optimal chip evacuation, very good cutting edge cooling, very effective against built-up edges
- to be recommended especially for larger tool diameters and tough materials

Peripheral cooling / Gührojet

Best external option: Optimal tool cooling and chip evacuation thanks to the direct route from coolant exit to cutting area

GÜHROJET
